A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the free antisense oligonucleotide specific conclusions.

Cauch as cystic faptorial elastase (medullash), targeted at the initiation codon. The method can be used to treat airway diseases conclusions as cystic fibrosis, asthma, chronic obstructive pulmonary disease.

Concontitis and other airway disease characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation componentisense degradation is prevented, thereby preventing adenosine connections.

Concording the following from the antisense on the substance of induced bronchoconstriction in patients with hyper-reactive airways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain binding a binding domain and an effector domain of the screening a page 36; 255p; English.

070472 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides.This generic formula can also be represented as follows: X(NNB)(CAC)(NNB)11(CAC)(NNB)(CAC)(NNB)2X(NNB)6-(CAC)(NNB)5(CAC)2(NNB)4. X and Y are flanking restriction sites generated by this and other generic sequences (070470-73) have invariant histidine residues incorporated into variant sequences. TSARs are
                                                                                                                                                                                                                                                                                                                                                         ï

Subject Claim 5; Page 38; 71pp; English.

Claim 5; Page 38; 71pp; English.

Claim 5; Page 38; 71pp; English.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the creat inspects sequence is an antisense oligonucleotide specific comploct. The present sequence is an antisense oligonucleotide specific compethod on be used to treat airway diseases such as cystic fibrosis, asthma, ohronic obstructive pulmonary disease, bronchitis and other calrway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine.

Confidence bronchoconstriction in patients with hyper-reactive airways.
concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The TSARs or composins. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP; 6 A; 12 C; 0 G; 0 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 5: Page 28; 71pp; English.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human IL3 receptor, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for treating alrayd disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonuclectide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonuclectide specific for the substance P receptor, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonuclectide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonuclectide specific for the human monocyte derived neutrophil chemotactic factor, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases bronchitis and other airway diseases characterised by an inflammatory response. By elimination adenosine from the antisense on, its libration upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. Sequence 168 BP; 0 A; 38 C; 45 G; 41 T;
                                                                                                                                                                        ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present sequence is an antisense oligonucleotide specific for the human neutrophil elastase (medullasin), targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchtis and other airway diseases. Characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                         A method for treating alray disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for chymase, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive alrways. Claim 1; page 2; 13pp; Japanesse.

This sequence encodes a novel envelope region of type C hepatitis virus (HCV). This fragment can be used for the preparation of a vaccine for hepatitis C. This fragment was prepared from the serum of non-A, non-B hepatitis patients and the envelope region DNA was amplified by PCR using the primer sequences given in Q55073-76.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example; Table 1; l6pp; English.

NOTE: This sequence has been indexed as represented in the sequence has been indexed as represented in the comparization, except that bases 'E' have been replaced by 'N'.

The features have been indexed according to the legend of table 1 on column 19/20 and the Sequence Summary of column 5 (sic). Note that the base numbering of the features does not correspond to the the sequence numbering below.

For another DNA sequence of HSB-1 gB see N71303 (P71135), and for HSV-2 gB see N71399 (P71136).

A pure non-glycosylated anino acid (AA) chain comprising a sequence corresponding to that occurring in glycoprotein B of HSV-1 or HSV-2 virus which is antigenic to HSV-1 of HSV-2, which contains no more than 750 AA residues, and which includes AA residues 135-649 inclusive is claimed. It can be used to produce vaccines for prophylaxis and treatment of HSV-1 and HSV-1.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human II3, targeted at the initiation codon. The method can be seed to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is privented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. 31 G; 9 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense obligonucleotide (ON) to the airway epithelium of the subject. Trible Robbing Proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain objectosure; page 36; 235pp; English.

O70473 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(CAC)(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)2(NNB)

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonuclectide (ON) to the airway epithalium of the subject. The present sequence is an antisense oligonuclectide specific for the human ILG, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammation response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
subject. The present sequence is an antisense oligonucleotide specific for the human IL6, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for treating alrawd disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonuclectide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonuclectide specific for the human vascular cell adhesion molecule-1 (VCAM-1), targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. Claim 5; Page 36; 71pp; English.

Method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the consider. The present sequence is an antisense oligonucleotide specific for the human interleukin 8, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense on, its liberation upon antisense degradation is prevented, thereby preventing adenosine.

C induced bronchoconstriction in patients with hyper-reactive airways.

Sequence 172 BP; O A; 35 C; 42 G; 39 T;
                                                                                                                                                                                                                                                                                                                                                                                    A method for treating alray disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human RANTES, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   23 bbtgtbggcbbbgcbgcbgggtgtggtgtccgbggbbtbtgggggbggcbgbtgcbggbgc 82

The present sequence is an antisense oligonucleotide specific for the human leukotriene C4 synthase, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gccctgcgcgcgcgbgbtcbcctgcbgggbgbbgtbggcttgcbgcbggbctcccbggbgg 119

Disclosure; fig 1: 11pp; German.

The vascular anti-coagulating protein (VAC)-alpha encoded by this CDNA is used in the preparation of monoclonal antibodies (MADS). The VAC-alpha is injected into a host animal, in conjugation with eg keyhole limpet haemocyanin, and the B-cells from the immunised hosts are then fused with myeloma cells. The resultant hybridomas (VAA-8 and VAA-9) produce Abs specific to VAC-alpha. The Abs can be used as immunoassay reagents to detect VAC proteins, as affinity ligands for purificn. of VACs and as medicaments for binding and/or neutralising VAC proteins in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                           Human proteins having anticoagulant and antinflammatory activity isolated from biological fluid by anion-exchange chromatographoc media. Bisclosure; p; English.

A human placenta cDNA library (Clontech) was screened to obtain this sequence. The cDNA does not contain a leader peptide sequence, indicating that PAP-I is probably not constitutively secreted. The product binds to phospholipid and inhibits phopholipase A2. The protein can substitute heparin or other anticoagulants in the treatment of disseminated intravascular coagulation, deep vein thrombosis, or other disorders. It also has antiinflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular anti-coagulating protein-alpha cDNA.

Recombinant placental coagulation inhibitor - useful for the prevention and treatment of thromboses or disseminated intra-vascular coagulation. Disclosure; p: English.

This recombinant DNA sequence comprises a promoter region, ribosome binding site, initiation sequence, termination codon and a transcription terminator in addition to the placental coagulation inhibitor gene. The polypeptide produced on culturing of transformed host cells exhibits strong anticoagulant activities and is useful for the treatcoagulation in the brain, heart and peripheral blood vessels. Sequence 1567 BP: 430 A; 332 C; 358 G; 447 T;
                                                                                                                                                                                                                                                                                             Score 28; DB 1; Length 1567; Pred. WPI sequence encoding anticoagulant PP4 protein

- and new recombinant protein, vectors, antibodies, etc.,

useful therapeutically and diagnostically.

Claim 1; table 1; 14pp; German.

DNA sequence encoding anticoagulant PP4 protein. This inhibits blood coagulation at the thromboplastin stage. The derived protein is 320 amino acids.

Sequence 1575 BP; 461 A; 322 C; 351 G; 441 T;
                                                                                                                                                                                                                                                                                                                                                                                 1353 atatatatttttaagaggctagagtgcttttagcctttttaaaa 1398

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Vascular anti:coagulating proteins -

useful as thrombin inhibitors, antiflammatory agents, etc

Disclosure; Fig 4/1-4/3: 183pp; German.

The DNA is produced by determining the amino acid sequence of isolated
and highly purified VAPs, constructing DNA probes on the basis of this
sequence, using the probes to search through suitable cDNA libraries,
isolating cDNA that hybridises with the probes, by inserting the cDNA
into a suitable vector, and using the vector to transform a host
organism. VAC-alpha has anticoagulant activity under certain
conditions, but loses this activity in the event of severe bleeding.

It acts by inhibiting conversion of factor X to factor Xa and conversion
of prothrombin to thrombin. It is structurally related to lipcocrtin I
(Nature, 320, 77, 1986) and lipocortin II (Cell, 46, 191/120, 1986) and
has similar antinflammatory and phospholipase inhibitory activity.

This sequence comprises novel mouse frizzled gene 7 (Mf27)

This sequence comprises novel mouse frizzled gene 7 (Mf27)

This sequence comprises novel mouse frizzled gene 7 (Mf27)

a What receptor (WhatR). Novel frizzled family members have been identified in Drosophila, mouse, human and Caenorhabditis (see T8985-92) and are considered to be What receptors. What receptors can be used in a novel, claimed method of screening for compounds which modulate the binding of a What polypeptide (secreted proteins involved in cell-to-cell signalling) to a What receptor. What is involved in (mammary) cancer and other processes involving growth, development and proliferation (both normal and abnormal).

Modulators identified by the claimed method are useful for treatment of diseases related to these conditions.

A cDNA library was prepared in lambda gt10 from mRNA isolated from ovaries of 3-4 month old cats. Plaques were screened using a mixture of probes encoding porcine ZPA, ZPB and ZPC proteins. Positive clones were analysed further by Southern hybridisation using the porcine probes and clones encoding feline ZPA, ZPB and ZPC proteins were identified. The deduced amino acid sequence from the feline ZPB clone was approximately 80% homologous to porcine ZPB

The present sequence is an antisense oligonuclectide specific for the human endothelin receptor ET-B, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine. Induced bronchoconstriction in patients with hyper-reactive airways. Sequence 144 BP; O A; 55 C; 46 G; 19 T;
               subject. The present sequence is an antisense oligonucleotide specific for the human endothelin ETA receptor, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. Claim 5; Page 34; 71pp; English.

Claim 5; Page 34; 71pp; English.

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the crowledge of subject. The present sequence is an antisense oligonucleotide specific complete the human defensin 3, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchtis and other altway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine.

Confidenced bronchoconstriction in patients with hyper-reactive airways.

WPI: 97-031871/05. Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of

Bovine folliculo stellate cells were used in the process of obtaining cDNA encoding bVEGF (120 amino acids from). The probes represented in Q10806 and -07 were used in the screening procedures. The sequence encodes amino acids 15-120 of bVEGF (see R10916).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                same factor. The two sequences can be enzymatically joined, after 010792 has been digested with the restriction enzyme Acci, to poduce a sequence encoding the full length, mature byEGF120 protein. The amino acid sequence contains one potential site for Nygycosylation at Asp 74 (corresp. to 75 in the human form). Inch DNA sequence is useful in the retrieval of DNA coding for length byEGF, or the corresp. factors of other species, including human protein, or related proteins in the same gene family. The sequence of Q44259 contains an open reading frame corresponding to the 164 amino acid bovine vasular endothelial cell growth factor (bVEGF-164, see R38920). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 120 amino acid bVEGF (R88916).

Mean 12.290; Variance 3.203; scale 3.837 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pp773 vector. Library is not normalized. (The normalized version of this library is NCI_CGAP_BT2.) Library was constructed by Bento Soares and M. Fatima Bonaldo."

J.Organisma—"Homo sapiens"

/note="Vector: pT7T3D-pac (Pharmacia) with a modified

polylinker; lst strand cDNA was prepared from pooled bulk

breast tumor tissue, and was then primed with a Not I -

oligo(dT) primer. Double-stranded cDNA was ligated to Eco

RI adaptors (Pharmacia), digested with Not I and cloned

into the Not I and Eco RI sites of the modified pT7T3

vector. This library is the normalized version of

NCI_CGAP_BRI.1. Library was constructed by Bento Soares

and M. Fatima Bonaldo."

with a modified polylinker; 1st strand cDNA was prepared
from normal prostate bulk tissue, and was then prined with
a Not I - oligo(dI) primer. Double-stranded cDNA was
ligated to Eco RI adaptors (Pharmacia), digested with Not
I and cloned into the Not I and Eco RI sites of the
modified pT713 vector. Library is normalized, and was
constructed by Bento Soares and M. Fatima Bonaldo."

double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of a modified p1713 vector (Pharmacia). Library went through one round of normalization to a Cot - 20. Library constructed by Bento Soares
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Deuterostomia; Chordata; Vertebrata; Gnathostomata; Osteichthyes; Sarcopterygii; Choanata; Tetrapoda; Amniota; Mammalla; Therla; Eutheria; Archonta; Primates; Catarrhini; Hominidae; Homo.
